

Galaxy evolution science with Hyper Suprime-Cam, Prime Focus Spectrograph, and ULTIMATE

Masayuki Tanaka

Hyper Suprime-Cam and the SSP Survey

A website will be launched very soon!

Hyper Suprime-Cam is a wide-field imager installed at the prime focus.

- 104 full depletion science CCDS plus 12 CCDs for guiding and focusing.
- It covers a 1.5 deg diameter field of view.
- 5 broad-band filters (grizy) and several narrow-bands are available.

Camera body

Wide-field corrector

Focal plane tiled with 116 CCDs

HSC filter system

Subaru Strategic Survey

International collaboration of **all Japan**, Princeton, and Taiwan.

Over 170 scientists put together efforts in a huge observing program of 300 nights over 5-6 years. The survey started in March 2014 and it is about 25% done.

S15B (Release Date: 2016.01.29)

This data release is the fourth full release and considered to be a candidate for the world-public release schedule in early next year. The data set involves all the SSP data taken in 2014.3 to 2015.11.

[Data Status and Important Notices](#) (Please read this page first.)

NOTE To publish papers, please follow the requirements listed in [this page](#)

Getting Catalog Products

Catalog Archive Server (CAS):SQL search for the catalog sources (*Please go to the following pages for getting source list!*)

[S15B Release Database](#): Information on Catalog Database Tables

[Search by Form](#)

[Direct SQL Search](#)

[Schema Browser](#)

[hscMap \(Sky Explorer\)](#)

(*) If the hscMap does not display any pseudo color image with a recent version of Firefox, please use a different browser in the meantime.

The latest internal release includes ~100sqdeg of full-color, full-depth data.
Over 20 million objects and 10TB of catalog data.

PFS-Galaxy Survey

(see talk by Tamura-san + Yabe-san later today)

Collaboration and Instrument

PFS Collaboration

(There are a few potential new partners.)

SSP is open to all “Japanese” researchers. Please join & commit !!

Caltech

PRINCETON
UNIVERSITY

JOHNS HOPKINS
UNIVERSITY

Max-Planck-Institut
für Astrophysik

From Tamura-san's slide

Will be available for open-use observations in mid-late 2019

PFS Instrument Parameters

Prime Focus Instrument				
Field of view	~1.4 deg (hexagonal - diameter of circumscribed circle)			
Field of view area	~1.2 deg ²			
Input F number to fiber	2.8			
Fiber core diameter	127 μm (1.12 arcsec at the FoV center, 1.02 arcsec at the edge)			
Positioner pitch	8 mm (90.4 arcsec at the FoV center, 82.4 arcsec at the edge)			
Positioner patrol field	9.5 mm diameter (107.4 arcsec at the FoV center, 97.9 arcsec at the edge)			
Fiber minimum separation ⁽¹⁾	~30 arcsec			
Fiber configuration time	~60-70 sec. [TBC]			
Number of fibers	Science fibers		Fixed fiducial fiber	
	2394		96	
Fiber density	~2000 deg ⁻² / ~0.6 arcmin ⁻²			
Number of A&G camera ⁽²⁾	6			
Field of view of A&G camera	~5.1 arcmin ² per one camera			
Sensitivity of A&G camera	r'~20.0 AB mag for S/N~30 (100) in 1 (10) sec. exposure			
Spectrograph				
Spectral arms	Blue	Red		NIR
		Low Res.	Mid. Res.	
Spectral coverage	380 - 650 nm	630 - 970 nm	710 - 885 nm	940 - 1260 nm
Dispersion	~0.7 Å/pix	~0.9 Å/pix	~0.4 Å/pix	~0.8 Å/pix
Spectral resolution	~2.1 Å	~2.7 Å	~1.6 Å	~2.4 Å
Resolving power	~2300	~3000	~5000	~4300
Spectrograph throughput ⁽³⁾	~58% (@500nm)	~55% (@800nm)	~52% (@800nm)	~52% (@1100nm)

Unique instrument for $z \sim 1$ galaxy science

PFS covers all the important emission/absorption features of galaxies around $z < \sim 1$. Above $z=2$, Lyman alpha line comes in the wavelength coverage. We have no redshift desert.

PFS-SSP: Science goals

- ◆ Cosmology (BAO at $1 < z < 2$)
- ◆ Galaxy evolution at all redshifts
- ◆ Galactic archeology

Resulting Survey Design

25 deg²

~200k color- selected galaxies
with $0.5 < z < 1.5$ (2hr exp)

~82k drop-out selected galaxies
with $2 < z < 6$ (3 hr exp)

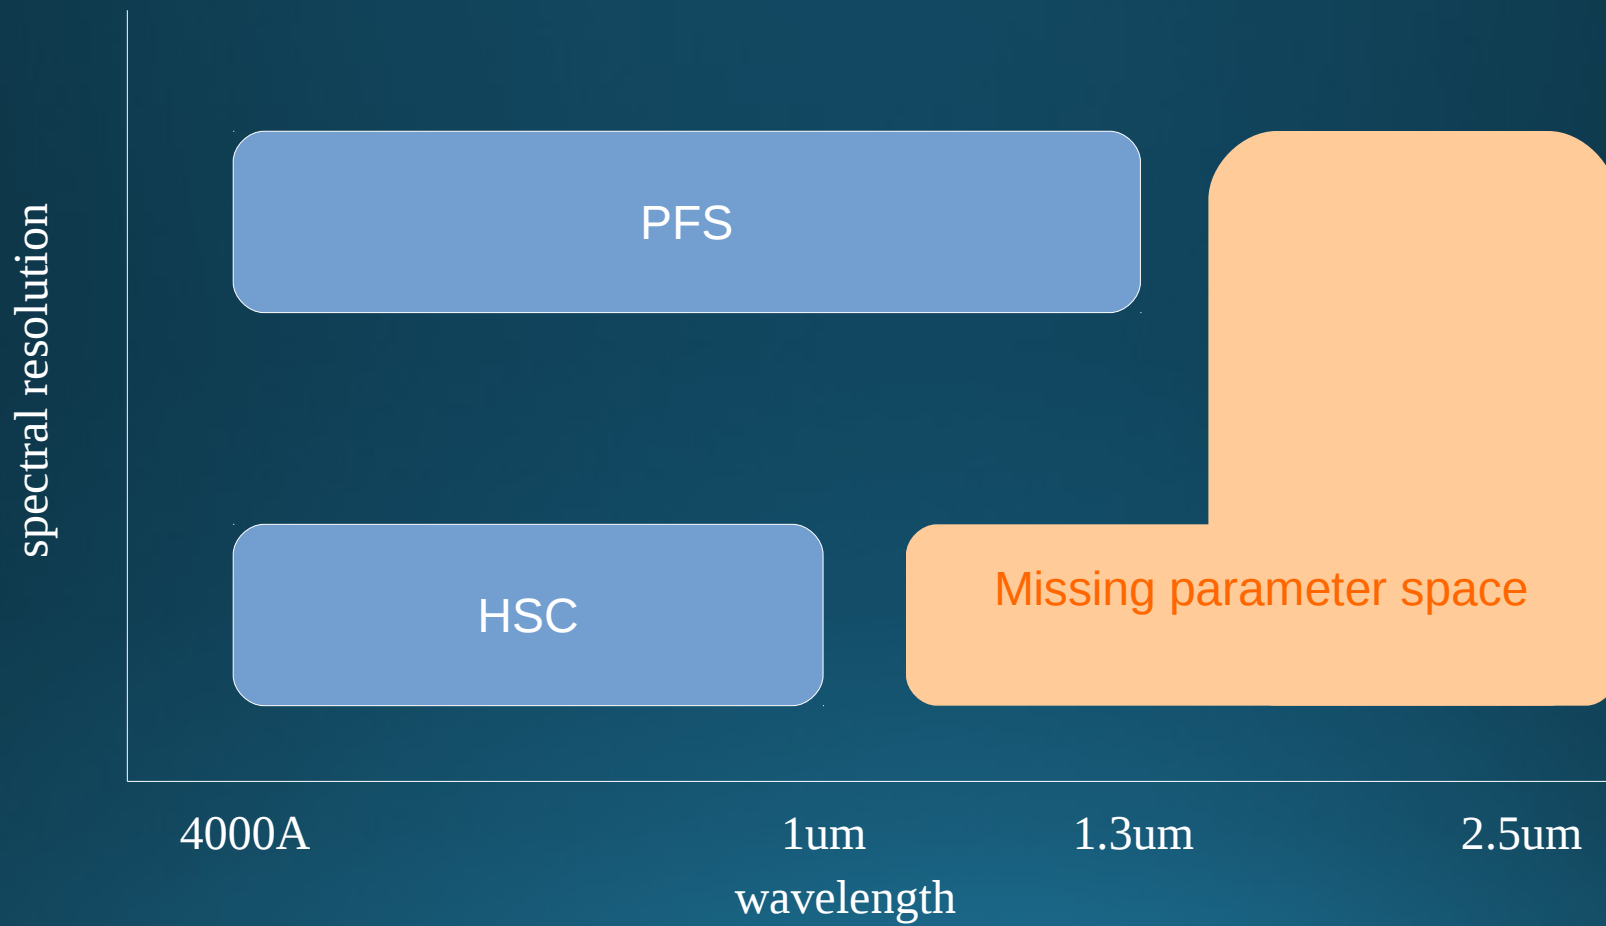

~20k LAEs with $z=2, 6$ (5hr exp)

~9 deg²

~170k color- selected galaxies
with $1 < z < 2$ (3 hr exp)

Current tentative galaxy survey design. The target fields are HSC-Deep fields.

Synergy with ULTIMATE-Subaru

HSC : 1.7sqdeg

PFS : 1.2sqdeg

ULTIMATE: 0.07 sqdeg

Imaging capability of ULTIMATE

- Night sky emission is a real killer.
- JWST will start to deliver excellent IR data in a few years.
- WFIRST will deliver near-IR (up to H?) data with image quality better than ULTIMATE over a much wider area.
- No way we can compete with LSST + WFIRST.
- NB imaging might be an option but science is quite limited.

Spectroscopic capability of ULTIMATE

- Jim Gunn says “spectroscopy is faster than imaging in nearIR. “
- PFS stops at $\sim 1.3\mu\text{m}$. If we observe the same objects with ULTIMATE, then we will have a complete coverage of optical-nearIR spectra for many thousand objects.
- The target selection in PFS-SSP is quite heterogeneous, but there is a flux-limited component. So, we can build upon PFS-SSP.
- I am not against IFU – it will be interesting. But, from the point of view of synergy with HSC and PFS, I think MOS is good.

Request for the MOS capabilities

- It would be nice to make it a survey instrument. It should be efficient in terms of both throughput and observing overhead.
- Cover the entire JHK bands in one go at $R \sim 4000$. H+K at minimum.
- FoV should be as large as possible.
- Should be more sensitive than MOSFIRE – it WILL be thanks to GLAO.
- No plate masks please. Use MOSFIRE-like mechanical slitlets.
- Make a sophisticated and automated 2d pipeline. Reduction software is as important as an instrument.

Q1: What do you think is the “KEY” science/observations for ULTIMATE in your research field? We hope to establish the very best science cases which are unique enough even in mid-late 2020's.

I think it is very hard to identify the very best science cases in the mid-late 2020's at this point because JWST is going to completely change the game. My suggestion here would be to design a survey for the first few years with MOIRCS+GLAO and design another survey later.

The first survey would be NB and/or Ks-band survey because the observing efficiency of MOIRCS is not very high in MOS mode and the spectral resolutions are too low. But, I do not have an excellent idea for the major science goals. The 2nd survey would be MOS follow-up of the PFS sources to obtain complete optical+nearIR spectra of many objects. The target selection should be defined after the JWST era.

Q2: Which instrument, WFC/MOS/IFU, is the 1st priority?

I am interested in extending the PFS spectra to H+K, so I would vote for MOS.

Q3: Good science case with MOIRCS+GLAO in 2020-2023?

Not really... As I said, NB and Ks-band imaging is perhaps what we should be doing, but I am not so enthusiastic about such a survey.

MOIRCS+GLAO does not seem to be as interesting as HSC and PFS. Perhaps we could use HSC and PFS on as many bright nights as possible?

Q4: Which survey design looks good for you?

NB and/or K-band imaging might be an option for the first few years with MOIRCS+GLAO. For the 2nd survey, intensive MOS follow-up of PFS sources is I think interesting. This will deliver data products with a lot of legacy value.

Summary

- A small NB and/or Ks-band survey with MOIRCS+GLAO, but should use as many bright nights as possible with HSC and PFS.
- The 2nd survey could be MOS follow-up of PFS sources. Make the MOS instrument as efficient as possible.
